

Dear candidate.

Hope you're doing well

we has brought up a quick trial practice for you.

To start, imagine a business leaving its own requirements on your table and you have to prepare the project document, low sketch wireframe and user stories for the “Tech team” as the “Product owner” position.

About the project (explained by the business owner)

My business needs a web app platform which my staff are able to login on and after that, they can see a temporary password (6 digits). The temporary password should be accessible through a full-width modal bottom sheet. The Authentication process will be done via mobile number and OTP.

So the business features request are:

- Ability to define staff via the below info
- Name & family
- National code
- Mobile number
- Gender
- Ability to login to the platform by OTP.
- Ability to show a temporary password to the logged in users.
- Ability to copy the temporary password quickly.
- Responsive design for mobile and medium desktop.

Note:

- **User stories should be created for the two state:**
 - **For the successful scenarios (means the user passed the step successfully):** All success messages after done action, should be considered on user stories.
 - **For unsuccessful scenarios (means the user passed the step unsuccessfully):** All error messages which the user may be faced with by doing specific actions should be considered.
- **Low sketch wireframe for all pages of the platform required. For this, You can use the most popular apps such Figma, XD, Sketch, etc. You must upload images of your designs to our website as a zip file. if you can't work with these apps, make the drawings on papers and send their photos us.**
